Patent No. 6551795

Sequence 30229, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc N. ULCLEIC AID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS:
TITLE OF INVENTION: ACIDICALION AND THERAPEUTICS
FILLS REFERENCE: 107196.136

CURRENT FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR FILING DATE: 1998-02-18
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 30229

LENGTH: 420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GENERAL INFORMATION:

US-09-552-991A-31918

i Sequence 3191B-1, Application US/09252991A

i Sequence 3191B-1, Application US/09252991A

i Sequence 3191B-1

i Batent No. 651795

i GENERAL INFORMATION:

i TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

I TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

I TITLE OF INVENTION: ACRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Agag polyprotein - human T-cell lymphotropic virus type 1 (isolate Caribbean)
NiContains: major core protein p19; major core protein p24; nucleic acid-binding protein C; Species: human T-cell lymphotropic virus type 1, HTLV-1
A; Note: host Homo sapiens (man)
C; Dacession: A28136

-!- CATALYTIC ACTIVITY: GDP-mannose + dolichyl phosphate = GDP + dolichyl D-mannosyl phosphate.
-!- PATHRAY: Glycosylation.
-!- SUBCELLULAR LOCATION: Endoplasmic reticulum.
-!- SUBCELLULAR: Belongs to the glycosyltransferase family 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           "Functional annotation of a full-length mouse cDNA collection.";

RIMLATION IN B4-2-1 CHO cells defective in MPD synthase activity.";

Submitted (JAN-1993) to the EMBL/GenBank/DDBJ databases.

L. FUNCTION: Transfers mannose from GDP-mannose to Golichol

monophosphate to form dolichol phosphate mannose (Dol-P-Man) which

is the mannosylation of proteins (By similarity).

C. GATALTIC ACTIVITY: GDP-mannose + dolichyl phosphate = GDP +

dolichyl D-mannosylation.

C. GATALTIC ACTIVITY: GDP-mannose +

dolichyl D-mannosylation.

C. H. PATHWAY: Glycosylation.

C. H. SUBCELLULAR LOCATION: Endoplasmic reticulum (By similarity).

C. H. SUBCELLULAR LOCATION: Endoplasmic reticulum (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright. -!- CATALYTIC ACTIVITY: ATP + L-histidine + tRNA(His) = AMP +
diphosphate + L-histidyl-tRNA(His).

-!- SUBCELDULAR LOCATION: Cytoplasmic.

-!- SIMILARITY: Belongs to class-II aminoacyl-tRNA synthetase family.
                                                                                                                                                                                              Gaps

Submitted (UND-2003) to the EMBL/GenBank/DDB databases.

-I. FUNCTION: Receptor for gastrin and cholecystokinin. The CKK-B

receptors occur throughout the central nervous system where they

modulate anxiety, analgesia, arounsal, and neuroleptic activity.

This receptor mediates its action by association with G proteins

that activate a phosphatidylinositol-calcium second messenger

-1- FUNCTION: Receptor for gastrin and cholecystokinin. The CKK-B receptors occur throughout the central nervous system where they modulate anxiety, analgesia, arousal, and neuroleptic activity. This receptor mediates its action by association with G proteins that activate a phosphatidylinositol-calcium second messenget
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

New oligopeptides comprising 2 arginine residues from degradation of proline-rich proteins, useful for preventing dental caries.

Claim 4; Page 24; 36pp; English.

The invention relates to human PRP-1-derived oligopeptides (AAB48771-AB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12013.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide transmers. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-tich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-

```
The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia the catabolism of arginine. The peptides of the invention, being argininetich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-derived oligopeptides of the invention
                                                                                                                                                                                                                          Human, PRP-1; proline-rich protein, saliva, dental caries, chromosome 12p13.2; arginine catabolism, ammonia production; pH increase, oral bacterium, caries prevention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New oligopeptides comprising 2 arginine residues from degradation of proline-rich proteins, useful for preventing dental caries.
                                                                                                                                                                                  Human saliva PRP-1 fragment (residues 100-108), SEQ ID NO:8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human saliva PRP-1 fragment (residues 99-108), SEQ ID NO:7.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPS (proline-trich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolished by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-derived oligopeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, PRP-1, proline-rich protein, saliva, dental caries,
chromosome 12p13.2; arginine catabolism, ammonia production, pH increase,
oral bacterium, caries prevention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New oligopeptides comprising 2 arginine residues from degradation of proline-rich proteins, useful for preventing dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

                                                                                                                                                                                                                                                                                                        The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which proteit against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by caral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, PRP-1, proline-rich protein; saliva; dental caries;

```
The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPS (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's succeptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the carabolism of arginine. The peptides of the invention being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-derived oligopeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Maisonneuve JL;

The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a dditionally encompasses expression vectors and host cells comprising a polypeptide of the invention; dusion proteins comprising a polypeptide of the invention; and proteins comprising a polypeptide of the invention; a vaccine composition (comprising P. acnes prepared via this method; a vaccine composition (comprising P. acnes polypeptides, a vaccine composition (comprising P. acnes polypeptides, polymelecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating anner protein. The polymucleotides and maken be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the preforming a diagnostic assay. The present a specifically claimed P. acnes polypeptide which is equence represents a specifically claimed P. acnes polypeptide which is the primer for the primer of the primer for this patent did not form part of the primer sequence data for this patent did not form part of the primer sequence data for this patent did not form part of the primer sequence data for the prime of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cartivity of (II) are to treat disease states involving (II). (II) is useful in gene therapy techniques to restore normal cartivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other trails to assess blodiversity and to produce other types of dasorders or other trails to assess blodiversity and can be premised and products dependent on DNA and and to produce other types of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human genome-derived single exon nucleic acid probes useful for analyzing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAIS7546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide #6360 encoded by probe for measuring placental gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cances such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzhahmer's disease, multiple scierosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                      Human, brain expressed exon, gene expression analysis, probe, microarray, Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy, cancer.
                                                            Human brain expressed single exon probe encoded protein SEQ ID NO: 31599.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0; Gaps

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver. Comprising one of 13109 defined nucleotide sequences given in the specification for complements fragments). The probe hybridies at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperipprotecinaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence but was obtained in electronic format directly from WIPO at Etp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                              Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human peptide encoded by genome-derived single exon probe SEQ ID 31538.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histlocytosis; lymphangioleiomyomcosis; Karagener syndrome; pulmonary histlocytosis; lymphangioleiomyome; pulmonary dyeolar proteinosis; fibrocystic pulmonary dysplasia; primary ciliary dyskineeis; pulmonary hypertension; hyaline membrane disease.

Complete acid probes for measuring gene expression in a sample derived from human lung comprising single exon mucleic acid probes having of the human lung comprising single exon mucleic acid probes having one of 12614 mucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes or the novel set of probes which hybridise at high stringency to a mucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung; comprising (a) contacting the array; identifying exons in a elkaryotic genome, comprising (a) array; identifying exons in a elkaryotic genome, comprising (a) array; identifying exons in a elkaryotic genome, comprising (a) array; identifying at last one exon from genomic sequences of the exkaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung marsh, the probe is included in the above mentioned microarray; assigning exons in the above and (b) measuring the expression of each of the exons in several its the exons should be assigned to a single gene, a single exon for exon microarrays should be assigned to a single gene, a peptide comprising on microarrays should be assigned to a single gene, a peptide comprising on analysis, and for identifying exons in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene expression analysis, and for identifying exons in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene expression analysis, and for identifying exons in dense particularly using human for the exons fundamental dense full mind dense sclerosis, gallenges (ILD), familial idiopathic pulmonary albenosidates; pulmonary alseases with a sarchi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       present sequence is a pertide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                  Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a spatially-addressable set of single exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 27; SEQ ID NO 31538; 634pp; English.

RESULT 14 AAU65747

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by p. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acnes in a patient comprises contacting a presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by charge linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was SAPHO syndrome, synovitis, acne, pustulosis; hypertosis, osteomyelitis uvekitis, endophthalmitis, bone, joint, central nervous system; ELISA, inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant. polypeptides and nucleic acids useful for diagnosing infections, especially useful for Propionibacterium acnes immunogenic protein #26643.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated polymucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymucleotides (ABM35624-ABM64356) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polymucleotide of the invention, antibodies against polypeptides of the invention, antibodies spainst polypeptides of the invention; fusion proteins comprising a polypeptide of the invention; a method for stimulating an immune response specific for a P. acnes polypeptides, polymucleotides, a vaccine composition (comprising P. acnes polypeptides, us this method; a vaccine composition (comprising P. acnes polypeptides, a table falls that express the polympetide); a method and kit conditions and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a proteins, T cell populations or antigen-presenting or treating acne polypeptides are useful for diagnosing, preventing or treating acne polypeptides are useful for diagnosing, preventing or treating acnes protein. The polymucleotides can also be used as probes or primars for nucleic acid hybridisation. The vaccine composition is useful for the simulating an immune response against P. acnes, or for treating an and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymucleotides of the invention. Note: The sequence data for this patent did not form part of reading frame) contained within the P. acnes polymorecent contained by an observance of the printed specification, but was obtained in electronic format directly format directly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Carter D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Maisonneuve JL;
Jones R, Carte
                                                                                                                                                                                                      Propionibacterium acnes predicted ORF-encoded polypeptide #26942.
                                                                                                                                                                                                                                                                                              Acne vulgaris; antiseborrhoeic; dermatological; antibacterial; immunostimulant; immune response; vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent NO. 6551795

GENERAL INFORMATION:
APPLICANT: Marc. N. Rubenfield et al.
APPLICANT: Marc. N. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILLE REPERENCE: 107196-118
CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18
